To Whom It May Concern,

One of the problems we face today is using too much petrol in cars, electricity and other niches that use petrol, and that petrol with all its progress is still a polluting factor to the air we breathe. Petrol causes emissions that can be reduced only by adding additives.

Gasoline additive known as "eco-save" is a product basically "green". In tests conducted in laboratories in England and Eastern Europe it was found that this particular additive is reducing polluting emissions by 60-65% of various motors and generator vehicles.

Long run of four years and thousands of kilometers of practical use of the "eco-save" additive with many different types of vehicles. With different types of engines. Shown no damage to the engines, moreover, it has shown an increase in power and a high decrease in pollution from the engines to the air.

In addition, tests conducted in Israel found that the savings can reach 20-40 percent, ranging from fuel consumption. Accordingly to those tests that can be shown, I urge and recommend anyone wanting to keep the air clean of contamination and of course save on petrol and the monthly cost to use this additive. I would like to emphasize that on top of each one of us the saving issue is the most important issue. Savings that will save money, low consumption and make more efficient the various fuels.

Best Wishes,
